METAL CEILINGS

Designed by Scott Tallon Walker Architects, the new McCann FitzGerald HQ building, located in the Grand Canal Harbour Docklands in Dublin, is one of Ireland's largest law firms and consequently needed to make a confident stylistic statement.

The building, designed by architects and main contractor, John Sisk and Son Ltd, features a circular atrium which draws natural light down through the seven storeys. One of the most stunning features of the building is the sleek metal detailing on the ceilings along with the curved linear grills and spandrel panels that surround the atrium, installed by SAS International.

The metal ceilings were designed by the architects to mirror the form of the building. The square SAS System 330 tartan grid mega panels that were installed across all seven levels reflect the external façade geometry, while the circular apertures for the luminaires and grills mirror the design of the central atrium. The result is a cool, futuristic interior that should stand the test of time. ■■■■
